MAJOR PERFORMANCE DRIVERS

After a slow start to the year, the GMO Resources portfolio came roaring back, delivering a solid 23% return net of fees in 2025. There were many areas of strength in our portfolio. Buoyed by historically cheap valuations and strong metals prices, our overweight industrial metals position rose almost 60%. Our copper, lithium, iron ore, uranium, and platinum group metal positions all generated strong returns.

Copper hit all-time highs toward the end of the year and continues to be an intriguing commodity. Data centers, renewables, electric vehicles, robotics, and other copper-intensive growth areas continue to pile on to what was already expected to be an undersupplied market. Mining companies have been scrambling in recent years to add to their copper exposure in an effort to capitalize on the growing demand and expected higher prices. Supply rarely seems to be able to keep up with projections, though. Dam collapses, mine flooding, squabbles with local governments, accidents, and seismic activity have all impacted copper supply in recent years.

After two and a half tough years for lithium, our lithium positions benefited from a rebound in lithium pricing in the second half of last year. Strong demand for lithium-ion batteries for energy storage systems (ESS) caught the market off guard, as did constraints to Chinese supply. Global supply was already expected to fall short by the end of this decade due to electric vehicle (EV) battery demand growth. Increased expectations for ESS and batteries for robotics have exacerbated the projected shortages.

Inception Date: 28-Dec-11

Performance for the year of inception is less than a full calendar year. Returns shown for periods greater than one year are on an annualized basis.

Risks: Risks associated with investing in the Fund may include: (1) Focused Investment Risk: the Fund invests its assets in the securities of a limited number of issuers, and a decline in the market price of a particular security held by the Fund may affect the Fund's performance more than if the Fund invested in the securities of a larger number of issuers; (2) Commodities Risk: commodity prices can be extremely volatile, and exposure to commodities can cause the value of the Fund's shares to decline or fluctuate more than if the Fund had a broader range of investments; and (3) Market Risk - Equities: the market price of equities may decline due to factors affecting the issuer, its industries, or the economy and equity markets generally. Declines in stock market prices generally are likely to reduce the net asset value of the Fund's shares. For a more complete discussion of these and other risks, please consult the Fund's Prospectus. **Performance Returns:** Annualized Returns may include the impact of purchase premiums and redemption fees. The GMO Trust funds are distributed in the United States by Funds Distributor LLC. GMO and Funds Distributor LLC are not affiliated.

Net Expense Ratio: 0.01%; Gross Expense Ratio: 0.01% Net Expense Ratio reflects the reduction of expenses from fee reimbursements. The fee reimbursements will continue until at least June 30, 2026. Elimination of this reimbursement will result in higher fees and lower performance. Gross Expense Ratio is equal to the Funds Total Annual Operating Expenses set forth in the Funds most recent prospectus dated June 30, 2025.

QUARTERLY INVESTMENT REVIEW

MAJOR PERFORMANCE DRIVERS CONT.

Clean energy bounced back in 2025 as well. In recent years, our out-of-index clean energy exposure has been a substantial drag on performance. However, strong fundamentals and solidification of U.S. public policy support helped clean energy charge to a strong year. Our wind positions more than doubled, and our solar positions weren't far behind. While our clean energy exposure creates a mismatch with the index, the diversification benefits are clear, and clean energy has generally been a positive contributor since the inception of the strategy in 2011.

In a testament to how cheap fossil fuel companies have been, the industry rose around 15% despite oil prices falling from \$77 to below \$63 over the course of the year. Unfortunately, our fossil fuel positions lagged considerably, primarily due to very difficult performance from one of our favorite oil and gas companies, Kosmos Energy. Kosmos is a small cap Exploration & Production company with significant leverage to the price of oil. As oil dropped, the market also punished Kosmos for some short-term operational issues. We believe the company has been deeply undervalued by the market and took advantage of the price drop to add to our position. We expect Kosmos to be a source of strong returns in the years to come.

Though our portfolio delivered strong returns last year, the index performed even better, driven by the explosive performance of gold and silver. We don't invest in these commodities, as we target commodities where we see secular demand growth and challenged supply, and the demand for gold and silver can be quite volatile. With gold and silver miners comprising almost a fifth of the index and up over 150% last year, it was a painful year to exclude them from our universe. Even if they had been part of our universe, we likely would have had minimal exposure, as the companies generally looked expensive, and that became a bigger issue as the year wore on.

As data centers and AI mesmerized the market last year, there was a growing awareness that energy may be a critical bottleneck. Data centers, manufacturing/industrial demand, and electrification (EVs, electric hot water heaters, heat pumps, etc.) are pushing electricity demand growth to levels the U.S. hasn't seen since the 1960s. The seemingly insatiable demand for electricity, both in the U.S. and globally, produces tailwinds throughout the resources landscape. Renewables will be critical to meeting the growing demand because they're cheap, clean, and readily deployable. Lithium-driven energy storage will be needed in large quantities in order to smooth out the intermittency of renewables and manage supply and demand in an increasingly stressed grid. Natural gas and nuclear generation will be needed to provide baseload power, underpinning growth in natural gas and uranium demand. Sitting at the heart of it all is copper, the key material for electrical applications.

Despite the tailwinds and last year's strong performance, valuations for resource companies continue to hover around all-time lows relative to the broad equity market. Remarkably, resource companies are trading at almost an 80% discount, a level almost never approached in the last 100 years. We've seen some data points recently that indicate renewed interest in commodities. It will be interesting to see if valuations move upward, but if they don't, investors should benefit from significantly higher yields than the broad equity market.

QUARTERLY INVESTMENT REVIEW

PRODUCT OVERVIEW

The GMO Resources Fund seeks to deliver total return by investing in the equities of companies in the natural resources sector. Long-term supply and demand dynamics in natural resource markets favor upward price trends – demand growth is being driven by population growth and the development of emerging markets, while supplies of cheap, easy to access natural resources are declining. To harness this trend, we focus on identifying companies in public equity markets that we believe will benefit from a broad rise in resource prices, across a diversified portfolio of energy, metals, agriculture, and water.

We can invest globally across the capitalization spectrum, including emerging markets, which allows us to identify attractive investment opportunities wherever they may be.

IMPORTANT INFORMATION

An investor should consider the fund's investment objectives, risks, charges and expenses before investing. This and other important information can be found in the funds prospectus. To obtain a prospectus please visit www.gmo.com. Read the prospectus carefully before investing.

Comparator Index(es): The MSCI ACWI (All Country World) Commodity Producers Index (MSCI Standard Index Series, net of withholding tax) is an independently maintained and widely published index comprised of listed large and mid capitalization commodity producers within the global developed and emerging markets. MSCI data may not be reproduced or used for any other purpose. MSCI provides no warranties, has not prepared or approved this report, and has no liability hereunder.

The GMO Trust funds are distributed in the United States by Funds Distributor LLC. GMO and Funds Distributor LLC are not affiliated.

ABOUT GMO

Founded in 1977, GMO is a global asset manager committed to delivering superior performance and advice to our clients. We are privately owned, which allows us to singularly focus on our sole business – achieving outstanding long-term client investment outcomes. Offering multi-asset, equity, fixed income, and alternative strategies, we invest with a long-term, valuation-based philosophical approach.
